Netflix OpenConnect Appliance Deployment

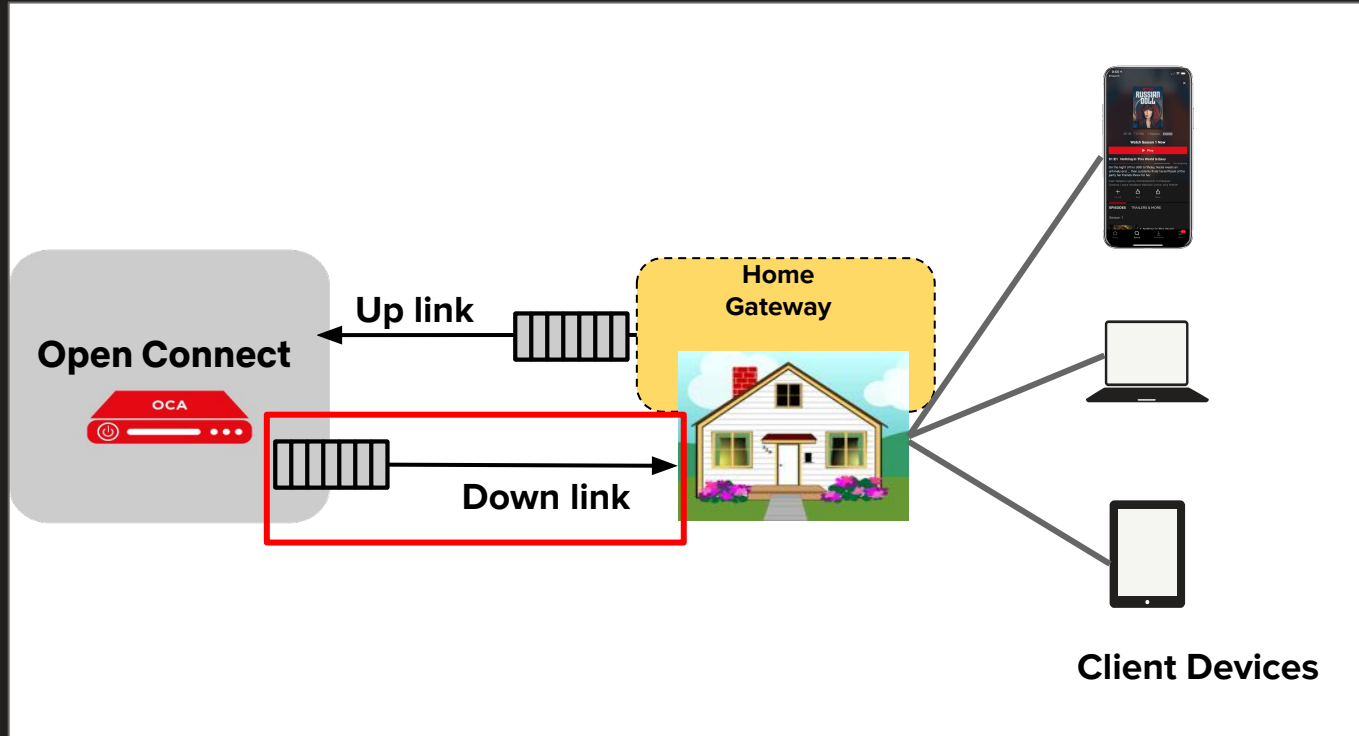

Congestion: Downstream vs. Upstream

Congestion: Downstream vs. Upstream

Congestion: Downstream vs. Upstream

Experimental Setup - Downstream Congestion

Stack A

Small VoQ
(25MB / 2ms)

NFLX
ROUTER

Stack B

Large VoQ
(500MB / 40ms)

NFLX
ROUTER

PNI

Experimental Setup (Cont.)

- TCP New Reno + RACK
- Traffic is distributed equally across the stacks
- Router buffer size is the only variable

Caveat:

- Not a randomized A/B experiment
- Preliminary observations, lots of questions

Network Metrics under Congestion

Small buffer stack

Big buffer stack

~100ms difference on
median of min RTT

Small buffer stack

Big buffer stack

~150ms difference on
median of max RTT

Network Metrics under Congestion

~1.5% extra of packet retransmission rate

QoE Metrics under Congestion

Big buffer stack increases rebuffer rate by ~30%

QoE Metrics under Congestion

Small buffer stack

Big buffer stack

~1s difference on
median play delay

Supplemental Playback

Watch Season 2 Now

Mothers, dads, daughters, sons, grandparents and more. Working together to turn home-cooked food into something extraordinary.

Popular on Netflix

Preview Content

Impact of Play Delay on Supplemental Playback

Browser Players

	# of Standard Playback (normalized)	# of Supplemental Playback (normalized)
Stack A (small buffer)	1.02	1.32
Stack B (big buffer)	1	1

Sampled TV Devices

	# of Standard Playback	# of Supplemental Playback
Stack A (small buffer)	1.03	1.19
Stack B (big buffer)	1	1

Video Quality under Congestion

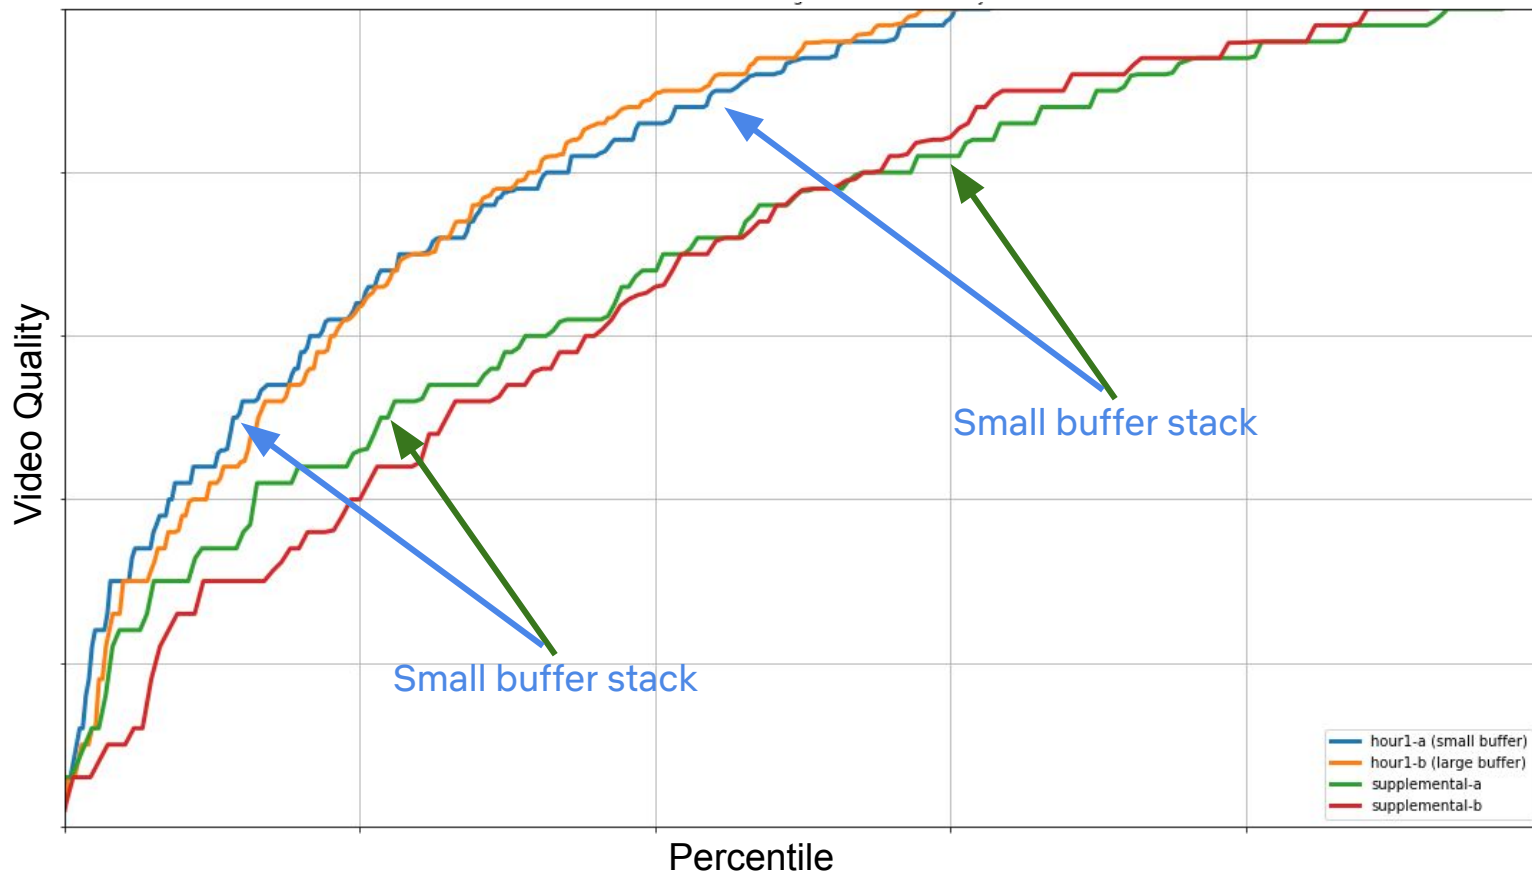

Small buffer stack average video quality (measured by bitrate) drops by 3%

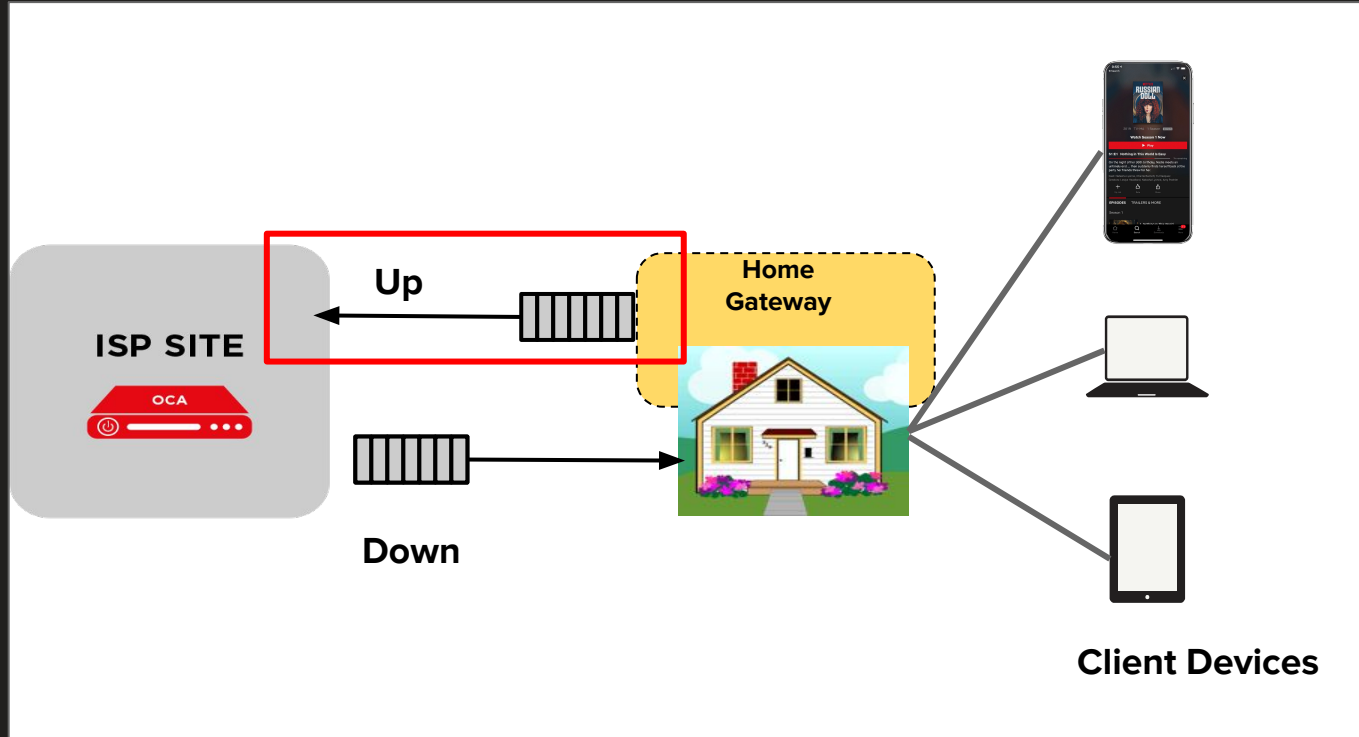

Big buffer stack

Small buffer stack

Video Quality under Congestion

Lab Experiment Setup - Upstream Congestion

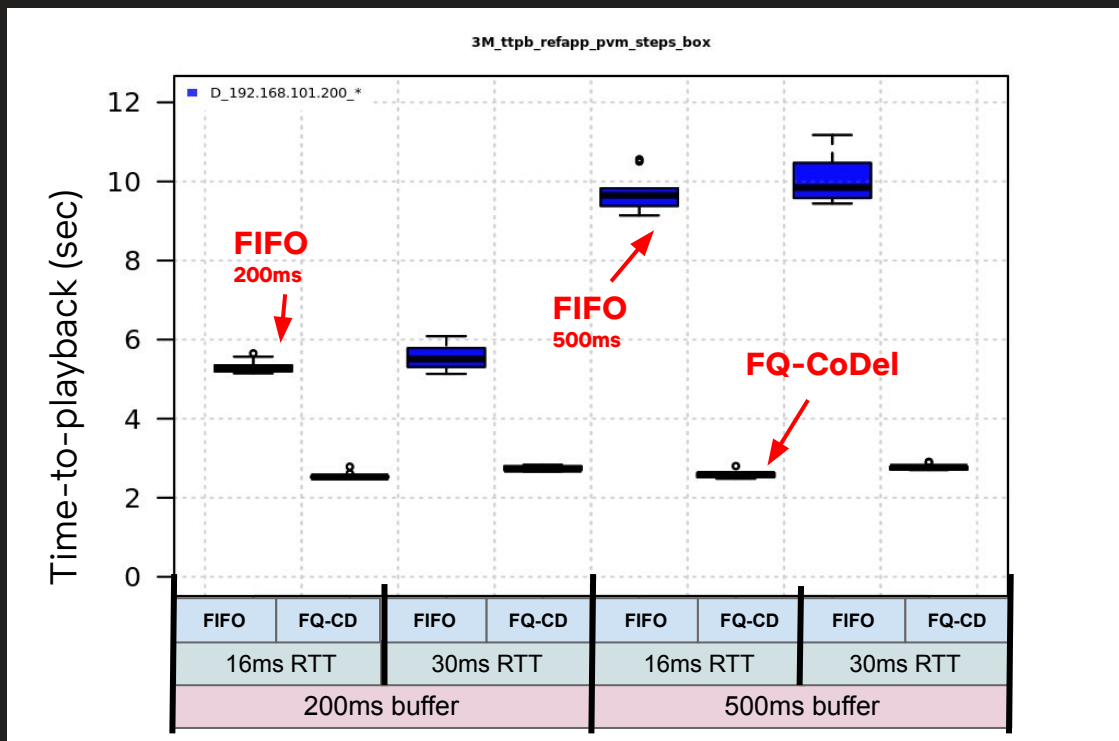

Test conditions

- **PHY speeds:** 15Mbps down / 3Mbps up
- **Buffering:** 500ms down / {200,500}ms up
 - FIFO down / FIFO up (common scenario)
 - FIFO down / FQ-CoDel up (proposed scenario)
- **Competing flow:**
 - Bulk data upload (constant TCP data stream)

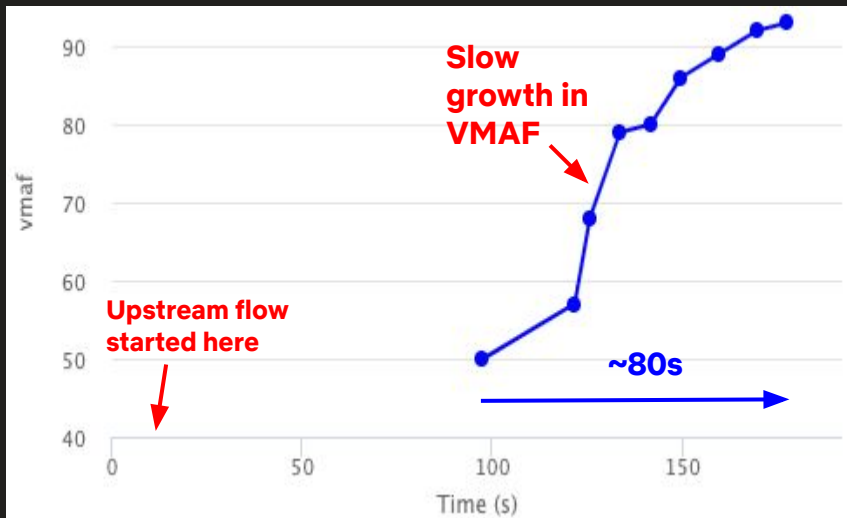

Congested: Play delay & Time to playback

(One bulk connection for upstream congestion, 16ms base RTT, 10 repeats)

Congested: VMAF vs time

(One bulk connection for upstream congestion, 16ms base RTT, refapp launched at t=20) via PVM

FIFO upstream

FQ-Codel upstream

Summary

- Downstream congestion:
 - Sizable QoE improvement on small buffer stack
 - Play delay, Rebuffer rate, Video quality
 - Even though retransmission rate is higher
 - Network metrics are important, but **the community should pay more attention to the customer-facing QoE metrics.**
- Upstream congestion:
 - Lab tests show that AQM improves QoE
 - Play delay, Video quality

Thank You
